handle chunking well, you may implement further logic if needed. Following is an example using a streamed response:

```
public function downloadFileChunked($filename)

{

    if (!Storage::disk('media')->exists($filename)) {

        abort(404, 'File not found.');

    }

    $path = Storage::disk('media')->path($filename);

    $mime = Storage::disk('media')->mimeType($filename);

     return response()->streamDownload(function () use ($path) {

        $stream = fopen($path, 'rb');

        while (!feof($stream)) {
```
