Overview

In this chapter, we will discover how to tap into the potential of scheduling, automation, and backup tasks to keep "myapp" running smoothly and efficiently. You're going to learn how to centrally manage recurring tasks by configuring Laravel's Scheduler, which lets you define all maintenance routines within a single file. We will learn how to integrate Laravel Scheduler with Linux cron by setting up a dedicated cron entry that checks and executes scheduled tasks every minute. We will also learn how to create custom Artisan commands for things like clearing log files, generating reports, and archiving media files. We will also learn how to keep an eye on and fix any issues that pop up, using tools like Laravel Telescope and Debugbar. This'll make sure your backups and automated routines run smoothly, even when you're under a lot of pressure. The goal of this chapter is to give you the skills you need to automate repetitive tasks, cut down on manual interventions, and keep your application's integrity and performance high through a thorough automation plan.
