```
cd myapp
```

Here, we will notice Laravel's standard structure is already in place—this is your playground for developing everything from basic routes to complex business logic. Each folder has its purpose, which makes the development process more intuitive as you continue to build and enhance your application.

Configuring Environment Variables and Verifying Installation

Setting up Environment File

The Laravel framework comes with a sample environment configuration file named We need to customize this file to match our specific Linux setup. To do this, simply copy the example to create a usable **.env** file:

```
cp .env.example .env
```
