config/app.php file if you want to verify the provider is loaded, though this is usually done automatically by Laravel's package auto-discovery feature.

Next, after installation, run your project server with:

---

php artisan serve

Then, browse You should see a new Debugbar panel at the bottom of your screen. This panel shows detailed insights about rendered views, executed queries, and processed middleware.

Setting up Laravel Telescope

The Laravel Telescope offers an advanced debugging and monitoring dashboard that records and displays information about every request entering your application. This tool not only complements Debugbar but also provides detailed log insights, making it easier for you to fine-tune your Laravel system as the project scales.

Now to install Telescope, run the following within your project
