Recipe 4: Integrating Git into Laravel

Now that you have a fully functional Laravel 11 project on your Linux machine, you should make sure that every team member can collaborate effectively. In the shared development environment of your office, you need to set up a solid version control system for the project, which we've named "myapp." Git is the industry standard for version control, and it lets you track changes, maintain commit history, and sync code across multiple developers. In this recipe,we will walk you through setting up a Git repository in "myapp," setting up commit conventions, and configuring remote repositories—all using Linux terminal commands.

Initializing Git Repository

First, navigate into “myapp”:

---

cd myapp
