Then, initialize the Git by running:

---

git init

This command sets up a new Git repository in your project folder, creating a hidden **.git** directory where Git will store all version history and configuration settings.

Configuring Commit Conventions

Creating .gitignore File

Before adding files to your repository, it's important to tell Git which files or directories to exclude. Laravel comes with a default **.gitignore** file, but verify that it excludes sensitive and unnecessary files like cached data, logs, and environmental configuration.

To do this, create a **.gitignore** file in your project root and ensure it contains entries similar to the following:
