```
git status
```

This command will help you track changes, identify untracked files, and confirm which files are staged for commit. Now you also need to remember to continue to commit regularly as you make changes.

For example, when adding new features or fixing bugs, use descriptive commit messages such as:

```
git commit -am "Feature: Add user authentication with Laravel Passport"
```

The use of **-am** flag allows you to add all modified tracked files and commit them in one go in order to streamline the workflow.

Also, you must remember to synchronize your work with your teammates by pulling the latest changes before starting new
