To define the controller logic, we first open **UserController.php** and define the **show** method to handle the dynamic route. We update the controller as shown below:

---

```
namespace App\Http\Controllers;

use Illuminate\Http\Request;

class UserController extends Controller

{

    /**

     * Display the specified user.

     *

     * @param  int  $id

     * @return \Illuminate\View\View
```
