Recipe 2: Using Resource Controllers for Efficient CRUD Operations

Let's say your "myapp" has gotten pretty complex, and you are having a hard time doing CRUD operations in a disorganized and inefficient way. During a team meeting, you all realize that managing CRUD functionalities individually for different models can lead to repetitive code and unorganized logic. We are going to use resource controllers to deal with this issue. It's a built-in Laravel feature that handles CRUD operations by organizing the related methods in a single controller. This method will keep your code base clean, make it faster to develop, and easier to maintain as you build out your application.

Creating Resource Controller

To start with, we first generate a resource controller for a model in your application. Suppose you want to manage a “Product” model, so here, you run the following Artisan command in oyur project directory:

---

php artisan make:controller ProductController --resource
