Overview

In this chapter, we will learn how to make your "myapp" more secure by improving how users are verified and authorized. We are going to learn how to integrate Laravel Breeze to establish a secure baseline for user login, registration, and password management. Also, we will use role-based access control with custom middleware to clearly define and enforce access hierarchies for different user roles.

We will also integrate social login functionality using Laravel Socialite to streamline user registration via popular social media platforms. To add an extra layer of security to your application, you are going to enable two-factor authentication with Laravel Fortify. This will protect user accounts. This chapter's gonna give you the lowdown on a bunch of security features that'll not only keep your app safe and sound, but also give you a flexible way to manage user permissions and access across your whole system.
