Registering Middleware

Now, to make the middleware available throughout your application, register it in the **app/Http/Kernel.php** file. In the **$routeMiddleware** array, we simply add an entry for your role middleware:

```
protected $routeMiddleware = [

    // other middleware entries

    'role' => \App\Http\Middleware\RoleMiddleware::class,

];
```

This step assigns the alias **role** to your middleware, making it easy to apply to routes.

Applying Middleware to Routes
