

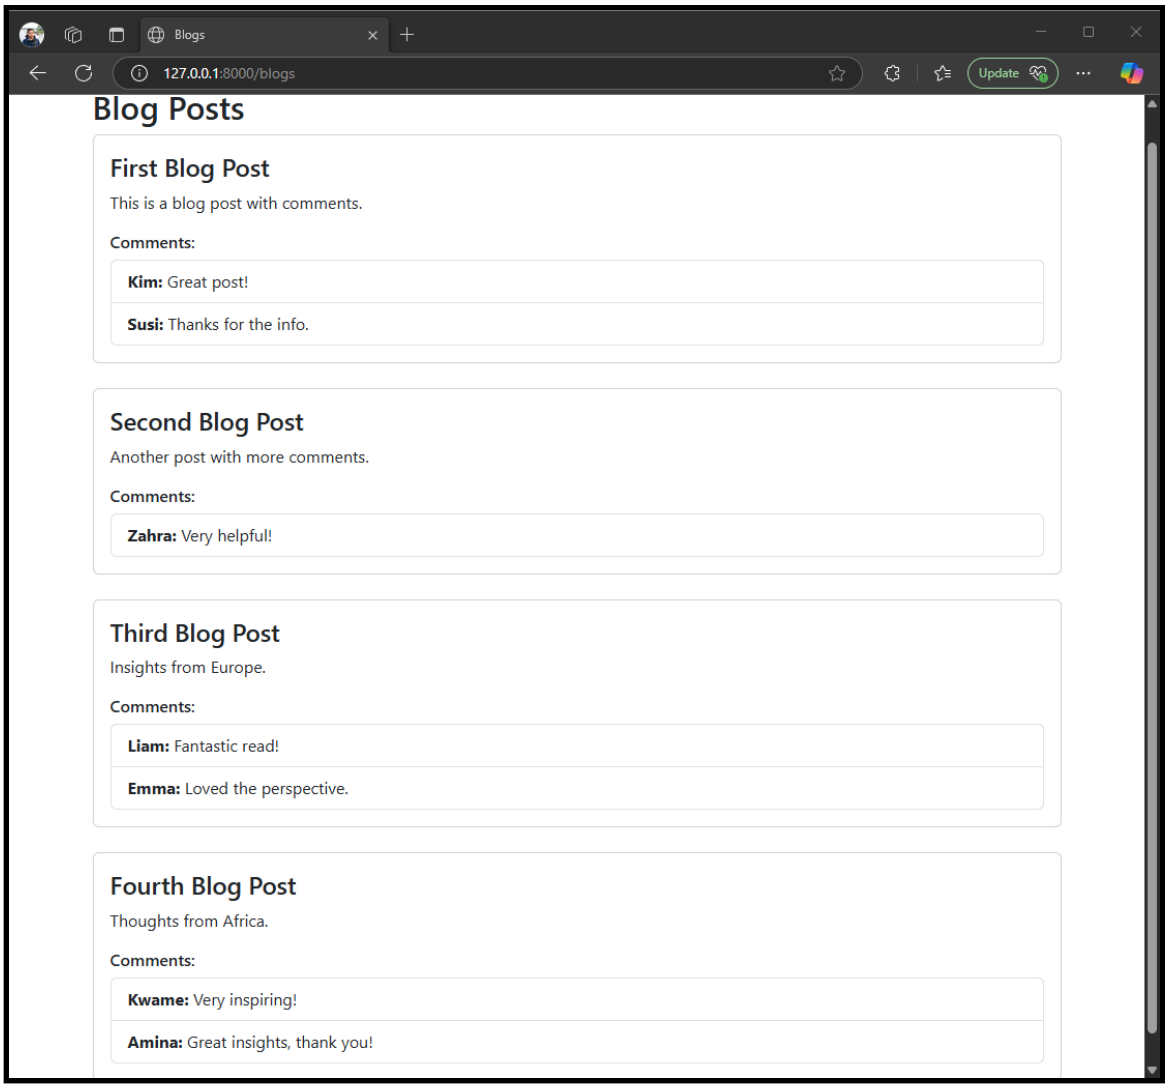

Figure 12.16: Blog posts with embedded comments.

12.11.5 Summary

In this lab, we created a Laravel 12 web app that uses MongoDB's embedded document feature to model a one-to-many relationship between blog posts and comments. We created a `Blog` model with embedded `comments`, seeded the database, and displayed the data in a Bootstrap-styled view. This approach shows how Laravel can work effectively with MongoDB's flexible data model for nested data structures.
