- PHP ≥ 8.2, Composer, and Visual Studio Code
- Basic knowledge of Laravel routing and terminal commands

> *This lab uses **PHP 8.4**, **Laravel 12** and **Visual Studio Code** as the primary editor.*

4.9.4 Steps

Here's a step-by-step guide to create a simple web application that demonstrates request handling and data passing in Laravel 12.

4.9.4.1 Step 1: Create and Open Laravel Project

We will create a new Laravel project named `lab-view` using Composer. Open your terminal and run:

```
composer create-project laravel/laravel:^12.0.3 lab-view
cd lab-view
code .
```

You should see the Laravel project structure in Visual Studio Code.

4.9.4.2 Step 2: Create a Controller

```
php artisan make:controller DemoController
```

Open `app/Http/Controllers/DemoController.php` and add these methods:

```
namespace App\Http\Controllers;

use Illuminate\Http\Request;

class DemoController extends Controller
{
    // Simple data passing
    public function hello()
    {
        $name = 'Laravel Learner';
        return view('hello', ['name' => $name]);
    }

    // Parameterized route
    public function greet($name)
    {
        return view('greet', ['name' => ucfirst($name)]);
    }
```
