```
use Illuminate\Support\Facades\Auth;
use Symfony\Component\HttpFoundation\Response;
class AuthenticateBasicAuth
{
 /**
  * Handle an incoming request.
  *
  * @param \Closure(\Illuminate\Http\Request):
  (\Symfony\Component\HttpFoundation\Response) $next
  */
 public function handle(Request $request, Closure $next):
 Response
 {
  return Auth::onceBasic() ?: $next($request);
 }
}
```

Additionally, attach a middleware to a route:

```
Route::get('/api/user', function () {
 // Only authenticated users may access this route
})->middleware(AuthenticateBasicAuth::class);
```

Custom User Providers

If you are not storing your users in a standard relational database, you will need to extend Laravel with your own authentication user provider. To define a custom user provider, we will utilize the **`provider`** method on the **`Auth`** façade. The user provider resolver should return an **`Illuminate\Contracts\Auth\UserProvider`** implementation:

```
<?php
namespace App\Providers;
use App\Extensions\TestEmployeeProvider;
use Illuminate\Contracts\Foundation\Application;
use Illuminate\Foundation\Support\Providers\AuthServiceProvider
as ServiceProvider;
use Illuminate\Support\Facades\Auth;
class AuthServiceProvider extends ServiceProvider
{
```
