Terminable Middleware

After the HTTP response has been sent to the browser, a middleware may occasionally need to do some tasks. If your middleware contains a **`terminate`** method and your web server employs FastCGI, the **`terminate`** method will be automatically invoked following the transmission of the response to the browser:

```
<?php
namespace Illuminate\Session\Middleware;
use Closure;
use Illuminate\Http\Request;
use Symfony\Component\HttpFoundation\Response;
class TerminatingMiddleware
{
 /**
  * Handle an incoming request.
  *
  * @param \Closure(\Illuminate\Http\Request):
  (\Symfony\Component\HttpFoundation\Response) $next
  */
 public function handle(Request $request, Closure $next):
 Response
 {
  return $next($request);
 }
 /**
  * Handle tasks after the response has been sent to the
  browser.
  */
 public function terminate(Request $request, Response
 $response): void
 {
  // Code Logic for termination
 }
}
```

Both the request and the response should be sent to the **`terminate`** method. Once a terminable middleware has been defined, it should be added to the
