manufacture strategic chemicals required for rocket engines, and a Rocket Propel ant Plant (RPP) to produce propel ants.

The development of Indian rockets in the twentieth century can be seen as a revival of the eighteenth century dream of Tipu Sultan. When Tipu Sultan was kil ed, the British captured more than 700 rockets and subsystems of 900 rockets in the battle of Turukhanahal y in 1799. His army had 27 brigades, cal ed Kushoons, and each brigade had a company of rocket men, cal ed Jourks. These rockets had been taken to England by Wil iam Congreve and were subjected by the British to what we cal 'reverse engineering' today. There were, of course, no GATT, IPR Act, or patent regime. With the death of Tipu, Indian rocketry also met its demise—at least for 150 years. Meanwhile, rocket technology made great strides abroad. Konstantin Tsiolkovsky in Russia (1903), Robert Goddard in USA (1914) and Hermann Oberth in Germany (1923) gave rocketry new dimensions. In Nazi Germany, Wernher von Braun's group produced V-2 short range bal istic missiles and showered fire on the Al ied Forces. After the war, both the USA and the USSR captured their
