The same goes for `EndDate`:

```
namespace App\ValueObjects;

class EndDate
{
  public Carbon $date;

  public function __construct(Carbon $date)
  {
    $this->date = $date->endOfDay();
  }

  public static function fromString(string $date): self
  {
    return new static(Carbon::parse($date));
  }

  public static function fromCarbon(Carbon $date): self
  {
    return new static($date);
  }

  public function __toString(): string
  {
    return $this->date->format('Y-m-d H:i:s');
  }
}
```
