The job itself is pretty straightforward:

```
namespace App\Jobs;

class NotifyUserAboutExportJob implements ShouldQueue
{
  use Dispatchable, InteractsWithQueue, Queueable, SerializesModels;

  public function __construct(
    private readonly User $user,
    private readonly TransactionReport $transactionReport,
  ) {}

  public function handle(): void
  {
    $this->user->notify(
      new ExportReadyNotification(
        storage_path($this->transactionReport->absolutePath()),
      ),
    );
  }
}
```

It just calls `$this->user->notify` with an `ExportReadyNotification` that implements a mail notification:
